General Pathology MCQs

1. What is the primary cause of cellular injury?
Genetic mutations
Infections
Hypoxia
Nutrition deficiency
Answer: Hypoxia
Cellular injury predominantly results from hypoxia, which deprives cells of oxygen necessary for aerobic metabolism. While other factors like infections and nutritional deficiencies can cause injury, hypoxia is the most common and fundamental cause.

2. Which of the following is an irreversible form of cell injury?
Oncosis
Hydropic change
Necrosis
Cell swelling
Answer: Necrosis
Necrosis is an irreversible cell injury characterized by cell swelling, membrane disruption, and uncontrolled release of cellular components, often provoking inflammation.

Cellular Responses to Injury

3. Which type of cellular adaptation involves an increase in cell size?
Hypertrophy
Atrophy
Hyperplasia
Metaplasia
Answer: Hypertrophy
Hypertrophy is the increase in cell size resulting in tissue enlargement, often in response to increased functional demand, such as muscle hypertrophy in athletes.

4. Metaplasia is best described as:
A reversible change where one differentiated cell type is replaced by another
An irreversible injury leading to cell death
Uncontrolled proliferation of abnormal cells
A decrease in cell number due to apoptosis
Answer: A reversible change where one differentiated cell type is replaced by another
Metaplasia involves the transformation of one differentiated cell type into another, often as an adaptive response to chronic irritants, e.g., replacement of ciliated columnar epithelium by stratified squamous epithelium in smoker's airways.

Inflammation and Repair MCQs

5. Which of the following is a hallmark of acute inflammation?
Granuloma formation
Vasodilation and increased vascular permeability
Fibrosis
Chronic infiltration of lymphocytes
Answer: Vasodilation and increased vascular permeability
Acute

inflammation is characterized by rapid vasodilation, resulting in redness and heat, along with increased permeability leading to edema and infiltration of neutrophils.⁶ Which cell type is primarily involved in chronic inflammation? Neutrophils Macrophages Eosinophils Basophils Answer: Macrophages Macrophages are central to chronic inflammation, where they phagocytose debris and pathogens, and release cytokines that orchestrate tissue repair and fibrosis.

Hemodynamic Disorders MCQs ⁷. Pulmonary edema is mainly caused by: Decreased plasma oncotic pressure Increased hydrostatic pressure Capillary permeability All of the above Answer: All of the above Pulmonary edema can result from increased hydrostatic pressure (e.g., left heart failure), decreased oncotic pressure (e.g., hypoalbuminemia), or increased capillary permeability (e.g., acute respiratory distress syndrome).⁸ Which of the following describes thrombosis? Formation of a blood clot within a vessel Dislodged embolus causing obstruction elsewhere Clot formation outside of blood vessels Bleeding due to vessel injury Answer: Formation of a blood clot within a vessel Thrombosis involves the formation of a fibrin-rich clot within the vascular lumen, which can occlude blood flow and lead to ischemia or infarction.

Neoplasia MCQs ⁹. Which of the following is a characteristic feature of benign tumors? Infiltrative growth Metastasis Well-differentiated cells Rapid mitotic activity Answer: Well-differentiated cells Benign tumors tend to resemble the tissue of origin closely (well-differentiated), grow slowly, and do not invade neighboring tissues or metastasize.

¹⁰. The most common genetic alteration associated with colorectal carcinoma is: KRAS mutation p53 mutation APC gene mutation HER2 amplification Answer: APC gene mutation Mutations in the APC gene are early events in colorectal carcinogenesis, leading to dysregulation of Wnt signaling and adenoma formation.

Systemic Pathology MCQs ¹¹. Which condition is characterized by excessive accumulation of amyloid protein in tissues? Necrosis Hemochromatosis Amyloidosis Gout Answer: Amyloidosis Amyloidosis involves extracellular deposition of amyloid, an insoluble protein that disrupts normal tissue architecture and function.

¹². Which of the following is a common cause of secondary (AA) amyloidosis? Chronic inflammatory diseases Genetic mutations Infections with bacteria Malignant tumors Answer: Chronic inflammatory diseases Chronic inflammatory conditions like rheumatoid arthritis lead to elevated serum amyloid A protein, which deposits as AA amyloid in tissues.
