Matlab code for cognitive radio spectrum sensing

Matlab code for cognitive radio spectrum sensing is an essential resource for researchers and engineers aiming to develop efficient dynamic spectrum access systems. Spectrum sensing is a critical function in cognitive radio (CR) technology, allowing secondary users (SUs) to detect unused spectrum bands without interfering with primary users (PUs). MATLAB offers a versatile environment for designing, simulating, and analyzing spectrum sensing algorithms, making it a popular choice for implementing these systems. In this article, we explore various MATLAB code implementations for cognitive radio spectrum sensing, focusing on fundamental techniques such as energy detection, matched filter detection, and cyclostationary detection, along with practical tips for optimizing their performance.

Understanding Spectrum Sensing in Cognitive Radio

What is Spectrum Sensing? Spectrum sensing is the process by which a cognitive radio detects the presence or absence of primary users in a given frequency band. Accurate sensing enables SUs to utilize idle spectrum slots opportunistically, increasing spectral efficiency and avoiding harmful interference. The primary challenge lies in reliably detecting PUs under various conditions such as noise uncertainty, fading, and shadowing.

Types of Spectrum Sensing Techniques

Cognitive radios employ several spectrum sensing techniques, each with its advantages and limitations:

- Energy Detection:** Measures the energy in a frequency band to infer PU activity. It is simple but sensitive to noise uncertainty.
- Matched Filter Detection:** Uses a known signal pattern to detect PUs with high accuracy but requires prior knowledge of the signal.
- Cyclostationary Detection:** Exploits the cyclostationary features of signals for robust detection, especially in low SNR environments.

Implementing Spectrum Sensing in MATLAB

Energy Detection Algorithm in MATLAB

Energy detection is the most straightforward approach to spectrum sensing. Below is a typical MATLAB code snippet for implementing energy detection:

```
``matlab
% Parameters
fs = 1e6; % Sampling frequency
N = 1024; % Number of samples
threshold = 1e-3; % Detection threshold
signal_present = false; % Initialize detection result

% Generate test signal (simulate PU
```

```

presence)t = (0:N-1)/fs; signal = randn(1, N); % Noise% Uncomment below to simulate PU
signal% signal = cos(2pi100e3t) + randn(1, N)0.5;% Calculate energyenergy =
sum(abs(signal).^2)/N;% Spectrum sensing decisionif energy > thresholdsignal_present =
true;disp('Primary user detected.');
```

elseif energy > threshold
disp('No primary user detected.');

```
end```
```

How it works: The code generates a noisy signal, which can be modified to include a known primary user signal. It calculates the average energy over N samples. If the energy exceeds a predefined threshold, the system concludes the presence of a PU.

Optimizations: Adjust the threshold based on noise variance. Use windowing functions to reduce spectral leakage. Implement averaging over multiple segments for more reliable detection.

Matched Filter Detection in MATLAB Matched filter detection offers optimal performance when the signal template is known. Here's an example MATLAB code:

```

```matlab% Known signal template
template = cos(2pi100e3t); % Example primary signal%
Received signal (with or without PU)
received_signal = template + randn(1, N)0.1; % With PU%
received_signal = randn(1, N); % Without PU%
Matched filter output
mf_output = sum(received_signal . template);%
Detection threshold
threshold = 0.5;
if mf_output > threshold
disp('Primary user detected via matched filter.');
```

elseif mf\_output > threshold  
disp('No primary user detected via matched filter.');

```
end```
```

**Key points:** The matched filter correlates the received signal with the known primary signal. High correlation indicates the presence of the PU. Requires prior knowledge of the primary signal characteristics.

**Cyclostationary Detection in MATLAB** Cyclostationary detection leverages the periodic features of signals. MATLAB implementations often involve spectral correlation analysis:

```

```matlab% Generate or load the received signal
received_signal = cos(2pi100e3t) + randn(1, N)0.5; % Example%
Compute spectral correlation
[cfs, freq] = cyclo_spectrum(received_signal, fs);%
Detect cyclostationary features
threshold = 1e-4;
if max(abs(cfs)) > threshold
disp('Cyclostationary feature detected: PU present.');
```

elseif max(abs(cfs)) > threshold
disp('No cyclostationary feature detected.');

```
end% Note: cyclo_spectrum is a custom or toolbox function```
```

Note: Implementing cyclostationary detection requires advanced spectral analysis tools, which are available in MATLAB toolboxes or custom scripts.

Practical Tips for MATLAB Spectrum Sensing Implementation

Handling Noise Uncertainty Noise variance can fluctuate, causing false alarms or missed detections. To address this: Use adaptive thresholds based on noise variance estimation. Apply averaging techniques over multiple sensing periods.

Improving Detection Performance Strategies include: Implementing cooperative sensing among multiple SUs to mitigate fading and shadowing effects. Using feature-based detection (cyclostationary) for robust performance in low SNR. Optimizing parameters such as window size, overlap, and threshold levels.

Simulation and Validation Before deploying in real systems, simulate various scenarios: Vary SNR levels to evaluate detection probability and false alarm rates. Test under different channel conditions like Rayleigh or Rician fading. Analyze the impact of mobility and interference.

Conclusion Developing efficient spectrum sensing algorithms in MATLAB is crucial for advancing cognitive radio technology. Whether through energy detection, matched filter, or cyclostationary methods, MATLAB provides powerful tools for designing, testing, and optimizing these algorithms. By carefully selecting parameters, managing noise uncertainty, and leveraging cooperative sensing, practitioners can enhance the reliability and efficiency of cognitive radio networks. Implementing these techniques in MATLAB not only accelerates development but also

provides valuable insights into the complex dynamics of spectrum sensing, paving the way for smarter, more adaptive wireless systems. **Keywords:** MATLAB code, cognitive radio, spectrum sensing, energy detection, matched filter, cyclostationary detection, spectrum analysis, wireless communication, dynamic spectrum access, simulation, signal processing

Understanding Cognitive Radio and Spectrum Sensing

What is Cognitive Radio? Cognitive radio (CR) is an intelligent wireless communication system capable of sensing its environment and making real-time decisions to optimize spectrum use. Unlike traditional radios, CR can identify unused spectrum segments—often called white spaces—and adapt its transmission parameters accordingly.

The Role of Spectrum Sensing Spectrum sensing is the process through which a cognitive radio detects the presence or absence of primary users in a given frequency band. Accurate sensing ensures that secondary (unlicensed) users do not interfere with primary (licensed) users, thereby maintaining regulatory compliance and network reliability.

A Closer Look: Matlab Code for Energy Detection Spectrum Sensing

Energy detection remains one of the most straightforward algorithms to implement and understand. Below is a step-by-step explanation of how to develop a basic energy detector in Matlab.

Step 1: Signal Modeling

Simulate primary user signals and noise. For simplicity, assume the primary user transmits a sine wave, while the secondary user collects signals contaminated with noise.

```

matlab
Fs = 10000; % Sampling frequency (Hz)
t = 0:1/Fs:1; % Time vector of 1 second
% Primary user signal (e.g., a sine wave at 1kHz)
f_signal = 1000;
primary_signal = cos(2*pi*f_signal*t);
% Noise signal
noise_power = 0.5;
noise = sqrt(noise_power)*randn(size(t));
% Received signal (simulate spectrum occupancy or vacancy)
% Case 1: Spectrum is occupied
rx_signal_occupied = primary_signal + noise;
% Case 2: Spectrum is vacant
rx_signal_vacant = noise;

```

Step 2: Calculate Energy

Compute the energy of the received signal over the observation window.

```

matlab
% Function to calculate energy
calculate_energy = @(signal) sum(abs(signal).^2)/length(signal);

```

Step 3: Threshold Setting

Set a detection threshold based on noise statistics, often through empirical means or theoretical calculations.

```

matlab
% Assuming noise-only scenario for threshold
noise_energy = calculate_energy(noise);
threshold = noise_energy * 2; % Example: 2 times noise energy

```

Step 4: Make Detection Decision

Compare the energy of the received signal to the threshold.

```

matlab
% Calculate energy of the received signals
energy_occupied = calculate_energy(rx_signal_occupied);
energy_vacant = calculate_energy(rx_signal_vacant);
% Detection decision
if energy_occupied > threshold
    disp('Primary user present: Spectrum occupied');
else
    disp('No primary user detected: Spectrum vacant');
endif

```

Advanced Spectrum Sensing Algorithms in Matlab

While energy detection offers simplicity, more sophisticated algorithms enhance detection accuracy, especially in challenging environments.

Eigenvalue-Based Detection Example

Eigenvalue-based detection analyzes the covariance matrix of the received signal. If the largest eigenvalue exceeds a threshold, the spectrum is considered occupied.

```

matlab
% Generate a multi-sensor signal (e.g., 4 antennas)
num_sensors = 4;
signal_length = 1000;
% Primary signal plus noise across sensors
multi_sensor_signal = zeros(num_sensors, signal_length);
for i=1:num_sensors
    multi_sensor_signal(i,:) = primary_signal + sqrt(noise_power)*randn(1,signal_length);
end
% Compute covariance matrix
R = (multi_sensor_signal * multi_sensor_signal')/signal_length;
% Eigenvalues
eigenvalues = eig(R);
% Test statistic (largest eigenvalue)
lambda_max = max(eigenvalues);
% Threshold (determined empirically or via theoretical analysis)
threshold_eigen = lambda_max * 1.5; % Example scaling
% Decide spectrum occupancy
if lambda_max > threshold_eigen
    disp('Spectrum is occupied based on eigenvalue test.');
else
    disp('Spectrum is vacant based on eigenvalue test.');
endif

```

QuestionAnswer

What is the basic MATLAB code structure for implementing spectrum sensing in cognitive radios?

A typical MATLAB implementation involves acquiring the received signal, applying a spectrum sensing algorithm (like energy detection), calculating the test statistic, and then comparing it to a threshold to decide on the presence or absence of a primary user.

How can I implement energy detection for spectrum sensing in MATLAB?

You can implement energy detection in MATLAB by computing the sum of squared magnitudes of the received signal over a window, then comparing this energy to a predefined threshold to determine spectrum occupancy.

What are some common algorithms for spectrum sensing in MATLAB for cognitive radios?

Common algorithms include energy detection, matched filtering, cyclostationary feature detection, and eigenvalue-based methods like the covariance matrix approach. MATLAB provides toolboxes and functions to facilitate these implementations.

How do I set the detection threshold in MATLAB for spectrum sensing?

The detection threshold can be set based on the noise variance and desired probability of false alarm, often derived from statistical distributions (e.g., chi-square). MATLAB code can compute this threshold using parameters like noise power and target false alarm rate.

Can MATLAB simulate multiple spectrum sensing algorithms simultaneously?

Yes, MATLAB can simulate multiple algorithms by coding each method separately and comparing their performance metrics such as detection probability and false alarm rate under different SNR conditions.

How do I evaluate the performance of spectrum sensing algorithms in MATLAB?

Performance can be evaluated by calculating metrics like probability of detection (P_d), probability of false alarm (P_{fa}), and ROC curves. MATLAB scripts can simulate many trials to statistically analyze these metrics under varying SNR levels.

Are there any MATLAB toolboxes or functions specifically for cognitive radio spectrum sensing?

Yes, MATLAB's Communications Toolbox and Signal Processing Toolbox include functions and examples for spectrum sensing, energy detection, and related signal analysis, which can be tailored for cognitive radio applications.

How can I improve the accuracy of spectrum sensing in MATLAB code?

Accuracy can be improved by using advanced algorithms like cyclostationary detection, combining multiple sensing methods, refining threshold selection, and incorporating noise variance estimation. MATLAB allows for prototyping and testing these enhancements efficiently.
